

## Version History (Version 202013)

### New UI Design:

- The design now scales with the width of your browser/screen.
- You can now rightclick devices, groups and users in the tree on the left.
- You can now change the color scheme of the UI if you click on your mail on the top right and change the console settings.
- A lot of view will update automatically whenever a device finished a command to instantly reflect some changes (e.g. last seen status).
- Drag'n'Drop should now be much smoother and more responsive for a lot of users.
- Every view should now be a lot more responsive and faster for most of the users.
- And many other little details got improved.

### EMM Management Console:

- [NEW] Phone numbers are now shown in the device report.
- [NEW] Improved the german translation and a lot of the english text aswell.
- [NEW] Should you enroll a device while it is selected in the console, it will become green immediately after the enrollment has been completed. No need to reload or anything!
- [NEW] "Command Log" in the "Device Log" Tab has been added. This shows which command has been sent to the device and if it was successful. If it failed, it will show additional information, if possible.
- [NEW] "Advanced Configuration has been added to the Gateway Configuration. With this you can now set the max headersize.
- [NEW] The last opened view will now be remembered and reopened when you login in again.
- [NEW] The enterprise appstore has been re-worked for iOS and Android and now features a search function.
- [NEW] The enrollment mail will now contain the QR Code for Android and iOS.
- [NEW] The design of the On/Off switches has been renewed.
- [NEW] The Pie Chart of the dashboard has been recolored.
- [NEW] Some parts have been made more responsive. The status bar at the top now always displays the correct live status and app lists get updated automatically without the need of a reload.
- [NEW] Some of the tables (e.g. installed App list) have been resized to work better with the highest console width.
- [NEW] Improved the caching of app icons for every app list which should decrease loading time after the first time.
- [NEW] Implemented some improvements for Chrome users.
- [NEW] Global Configuration has been extended with more templates.
- [NEW] Changed the way the appliance uses to contact the mail server to avoid conflicts with some mail server settings.
- [NEW] After creating a device the values for operating system, device typ and ownership will be saved and applied for the next device, giving you the ability to add devices much more efficient.
- [NEW] Added more options to the mail templates.
- [FIX] The "Update Target" Button in the InHouse App DB could not be changed correctly. This has been fixed.

- [FIX] Whenever a device, group or user got deleted, it was still selected. Now after deleting one of these will automatically select an element above the deleted one.
- [FIX] When using the Universal Gateway for mail configuration, in some cases the username was not set correctly on the device. This has been fixed.
- [FIX] Under certain circumstances the server manager could not be reached on multi-client systems. This was fixed.
- [FIX] Under certain circumstances it took much longer than expected to load a group when clicked on it. This has been fixed.
- [FIX] Some apps that should have an Icon with transparency had a black background. This has been fixed.
- [FIX] In some scenarios, external storage could not be added to the content box (e.g. FTP). This was fixed.
- [FIX] In rare cases, old GPS positions were not deleted as expected as soon as they were older than 30 days. This now works again as expected.
- [FIX] In rare cases, it happened that a button got switched to from On to Off or vice versa without displaying it correctly until saving. This got completely fixed.
- [FIX] In many cases the external appliance configuration was not reachable although it was configured correctly. This now works again.
- [FIX] If the SSL port was not 443, requests were not correctly forwarded to port 80. These are now forwarded to the configured SSL port.
- [FIX] GPS positions were correctly transmitted by the devices but not displayed. This was fixed.
- [FIX] Fixed some text and translation.

## Android:

- [NEW] "Android for Work" has been added as operating system. Creating a device using this operating system will hide every setting which is not required.
- [NEW] You can now reset the password with a custom password.
- [NEW] URL Kiosk Mode now properly shows that a page is currently loading. Prior to this, this happened in the background without a visual feedback.
- [NEW] The "+" button in the installed apps list has been removed. The recommended way to add apps that should be installed is using the mandatory app list. Due to confusion and problems caused by the "+" button, we decided to remove it.
- [NEW] The information "Last Push" has been added to Android devices.
- [NEW] Text fields in the android clients have been adjusted so passwords (e.g. uninstall password) are hidden and e-mail fields are recognized as such.
- [NEW] Support for new Ikarus Version with license key added.
- [NEW] Samsung KNOX functions can now be used in Android for Work Device Owner Mode
- [NEW] QR Code Enrollment is now possible with native android enrollment.
- [NEW] License Management for Ikarus has been added in General Settings -> App Management -> Third Party Apps.
- [NEW] Implemented different methods to block splitscreen and picture in picture while kiosk mode is active.
- [NEW] Changed the wording from Samsung SAFE to Samsung KNOX since Samsung also switched to this terminology.
- [NEW] Changed the system which is used to push devices to resolve push issues on some Android 9 devices.
- [FIX] Fixed an issue which prevented users from linking a google account with the console.

- [FIX] While searching for playstore apps, some icons were not displayed correctly. This has been fixed.
- [FIX] Whenever the AfW App Store contained more than 50 apps, every app got removed. This has been fixed.
- [FIX] Under certain circumstances, AfW devices were not pushed correctly. This works now in every case and with every device.
- [FIX] There was an issue that prevented setting a background on android. This now works again as intended.
- [FIX] The biometric authentication option for AfW devices has been removed by accident. This feature is now back!
- [FIX] Play Store Search did not work due to changes by google. This has been adjusted so the app search works again as expected.
- [FIX] InHouse Apps could not be distributed via Enterprise App Store in many cases. This was fixed.
- [FIX] In very rare cases the installed apps list was not displayed correctly.
- [FIX] In rare cases inHouse apps got not installed on the devices. This has been fixed.
- [FIX] In certain cases pushing android devices did not work, this has been fixed.
- [FIX] In URL Kiosk Mode: On certain devices, when the kiosk exit popup got closed without entering the exit password, it was impossible to get the popup again without restarting the device. This has been fixed.
- [FIX] Group Profiles for AfW Devices could not be copied. This has been fixed.
- [FIX] Fixed a bug in the URL kiosk mode where the original URL got loaded whenever the screen orientation changed.
- [FIX] Exiting the kiosk by using a password and resuming it via the apptec client resulted in the kiosk mode not being activaed correctly. Therefore non-kiosk apps could be opened.
- [FIX] Due to major changes made by Google to the Playstore, Playstore apps were not displayed and added correctly. This also added broken entries to the list. Searching and adding apps now works again. Also all corrupt entries were removed automatically.
- [FIX] A few apps have special characters in their name. This caused the insalled apps list to be empty. This has been fixed.

## iOS:

- [NEW] You can now enter a bundle identifier to the Black- or Whitelist.
- [NEW] User Enrollment has been added. Please note that the option to add apps via VPP in device mode will come in the next update.
- [NEW] The "+" button in the managed apps list has been removed. The recommended way to add apps that should be installed is using the mandatory app list. Due to confusion and problems caused by the "+" button, we decided to remove it.
- [NEW] The bypass code for the activationlock can now be shown in the console and used to manually remove the activationlock.
- [NEW] The Built-In Security Container can now be customized to allow screenshots and other functions.
- [NEW] Support for the Apptec VPN has been added.
- [NEW] Some settings need supervised mode since iOS 13. The affected settings are now marked accordingly. **Hint:** Devices which were rolled in before the update to iOS 13 are not affected.
- [NEW] Semiautomatic APNS certificate creation has been added.
- [NEW] Overhauled the whole system to get VPP licenses which will make the process much faster and more stable, especially for higher amounts of licenses.

- [NEW] New “Skip” options has been added to the DEP profile to match the latest iOS versions.
- [NEW] Improved they way the enrollment got processed if you add the device to the MDM and to DEP using the Apple Configurator 2. This also avoids the creation of 2 identical devices which occurred in rare cases while using this method.
- [NEW] Extended the lifetime of a single push to 100 days, so devices will receive a push even after being offline for 100 days.
- [NEW] Activity App has been added to the Sys App Restrictions.
- [FIX] When using Per-App VPN not every VPN method was displayed correctly. This has been fixed.
- [FIX] When setting passcode restrictions, some values were not set correctly. This has been fixed.
- [FIX] System App Restrictions did not work properly in rare cases. This has been fixed.
- [FIX] Some restrictions were not displayed correctly. This has been fixed.
- [FIX] OpenVPN profiles were always incorrectly stored as OnDemand VPN on the end device. This was fixed.
- [FIX] In certain cases app settings from group profiles were not applied correctly. This now works in every scenario.
- [FIX] Due to changes of Apple, the device log did not display every error correctly. This has now been fixed.
- [FIX] Different fixes for VPP have been implemented. Now the license assignment should be reliable as before.
- [FIX] Certificate Authentication with mail profiles did not work properly in most cases. This has been fixed.
- [FIX] Added missing Appstore Countries.
- [FIX] Activating certain supervised settings caused push problems, this has been fixed.
- [FIX] APN Legacy was not working correctly in some cases. This has been fixed.
- [FIX] “Open from managed to unmanaged” could not be changed in some cases. This should now work again as intended.

### Windows 10 PC:

- [NEW] Added support for big UWP (appx & appxbundle) and MSI apps.
- [NEW] You are now able to remove some architectures (e.g. ARM) from bundles since this can cause problems on devices not matching this architecture.
- [NEW] “Wipe Device” has been added.
- [NEW] Full support for Windows 10 Version 1809 has been added
- [NEW] Adjusted the UI for upload of UWP (appx & appxbundle) and MSI apps.
- [NEW] Support for BitLocker configuration added.
- [NEW] Support for Firewall configuration added.
- [NEW] Support for VPN via the Apptec Universal Gateway added.
