

RAYVENTORY®

Discover to Manage: Oracle Java

Due to a license change by Oracle, commercial use is only possible with a paid subscription. Existing installations can only be updated with a valid license.

What does this concretely mean for you as a company?

First of all, it is essential to obtain a holistic overview of installed Oracle Java versions. This includes, among other things, information about the version, license, and deployment location.

Those who remain on old versions are at the mercy of possible security gaps due to the lack of security patches.

Complete transparency with RayVentory

Thanks to the flexible inventory technologies of the Technology Asset Inventory solution, you can gain complete transparency over your hardware and software portfolio in networks of any complexity or separation within the shortest possible time.

RayVentory detects not only the total number of installations and the actual usage of Oracle Java (JRE/SDK), but also the parameters required for licensing.

Your advantages with our Technology Asset Inventory solution

The interaction of different components in RayVentory provides you with a meaningful and targeted reporting of your Oracle Java data after the inventory.

Our experts provide concrete assistance with potential streamlining measures to successively optimize your software portfolio and save resources and licensing costs.
